## Common Grinding Wheels - Abrasive Material:

## 1. Abrasive Material:

Category

Features

Usage

Brown Corundum

(A)

High hardness and toughness

It can be used for grinding medium and high tensile strength metal such as ordinary carbon, steel, alloy

White

Corundum

Its hardness is higher than that of the A. Grains are easily broken. The edges of the grains are sharp wit

It can be used for grinding harder material and metals sensitive to heat such as chilled steel, high carbo

Pink Corundum

(PA)

The hardness is close to WA, but the hardness is higher. The grains are sharp. It is much durable,

Used for the grinding of the chilled steel, cutting tools and work-pieces of alloy steel as well as the precis

Mixture of A and WA

(A/WA)

It possesses the advantage of both A and WA

It is suitable for the grinding of nodular, cast iron crank shaft, cam shafts and other work-pieces.

Green Silicon

## Common Grinding Wheels - Abrasive Material:

Carbide (GC)

With high hardness and brittle. Its grain edges are sharand it is of excellent capacity of the heat -transm

It is suitable for the grinding of the cutting tools and work-pieces of hard alloy, and non-ferrous metal and

Black Silicon

Carbide (C)

With high hardness and brittle. Its grain edges are sharp and it is of certain capacity of the heat -transm

It is suitable for the grinding of non-ferrous and non-metal materials.
